INTERACTIVE EXPENSE TRACKER

Web Application Assessment Project Report

COMPLETED

DATE OF SUBMISSION	ORGANIZATION / ASSIGNMENT	TECHNOLOGY STACK	CURRENCY STANDARD
November 9, 2026	Veda Technology Assessment	HTML5, CSS3, JavaScript	Indian Rupees (INR - Rs.)

1. Executive Summary

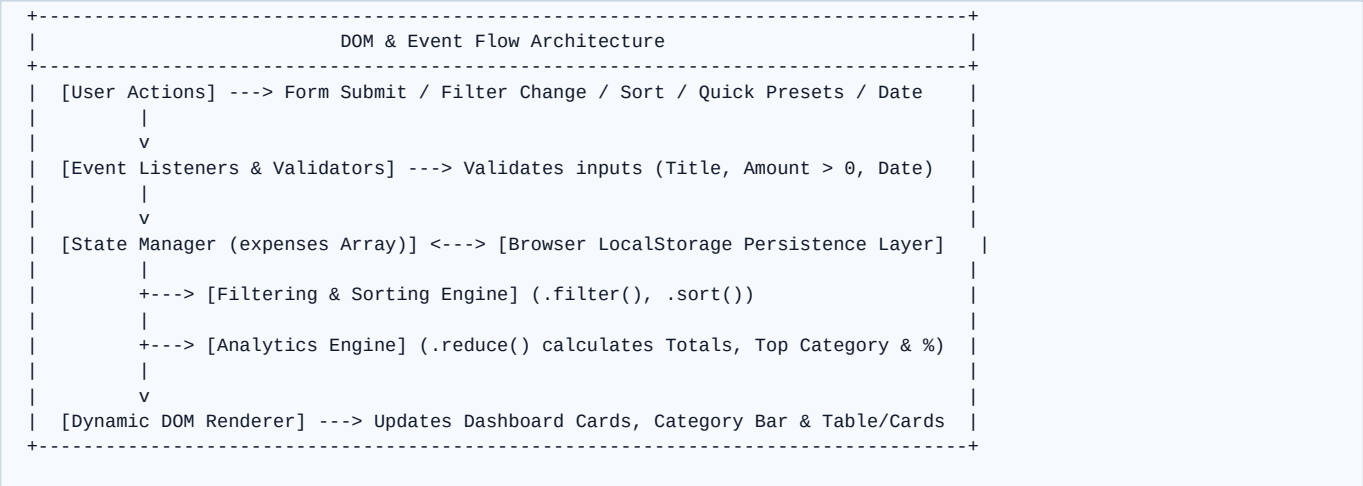
The Interactive Expense Tracker is a responsive, client-side personal finance web application built strictly with semantic web standards: HTML5, CSS3, and modern Vanilla JavaScript (ES6+). Zero external frameworks, build tools, or runtime dependencies were used, ensuring lightning-fast load times and full portability.

All data operations are handled in-memory and persisted synchronously using the browser LocalStorage API, enabling persistent offline tracking across browser reloads. The application implements full CRUD operations, multi-criteria filtering, multi-attribute sorting, live mathematical analytics, a responsive custom calendar modal, custom non-overflowing combobox dropdowns, and an automated CSV data export engine.

2. Assessment Deliverables Compliance Matrix

ASSESSMENT DELIVERABLE	IMPLEMENTATION DETAILS	STATUS
Expense Entry Form	Title, Amount (Rs.), Category combobox input, and Date with inline validation.	PASSED
Expense Listing	Dynamic table that transforms into individual touch cards on mobile screens.	PASSED
Edit Functionality	Pre-fills form with "Editing" badge and Cancel button (with Esc shortcut).	PASSED
Delete Functionality	Confirmation prompts before removal; updates LocalStorage & UI immediately.	PASSED
Category Filtering	Custom mobile-contained dropdown dynamically synced with all entered categories.	PASSED
Date Range Filtering	From/To date filter via responsive modal + quick presets (Today, Week, Month).	PASSED
Total Calculations	Overall Total, Filtered Total, Top Category, and Category Percentage Bar.	PASSED
LocalStorage	Persists records across browser sessions; includes initial starter dataset.	PASSED
Responsive UI	Mobile-first design with 44px tap targets, zero iOS zoom, no popup clipping.	PASSED
Data Export Engine	One-click RFC 4180-compliant CSV download generated via in-memory Blobs.	PASSED

3. System Architecture & Data Flow



4. Engineering Solutions for Mobile Responsiveness

A. Mobile Table-to-Card Transformation (<= 640px)

Traditional data tables overflow horizontally on mobile devices. Using CSS custom data-label attributes and flexbox, each table row automatically transforms into an

B. Custom Mobile-Contained Dropdowns with Smart Drop-Up

Native select popups overflow card boundaries on narrow viewports. Custom dropdowns were built with width: 100% boundary constraints. If space below is crampe

C. Responsive Calendar Modal & Quick Range Presets

Desktop browser calendar popups clip outside narrow containers. A custom centered modal calendar was created with month/year navigation, plus one-tap quick da

D. Interactive Category Combobox with Datalist Replacement

Native HTML5 datalist elements fail to show dropdowns on mobile previews. Replaced with an interactive combobox input that supports both freeform text entry and

5. Git Version Control Milestones

`4c9b285`	docs: generate formal project report with date
`8b33548`	fix: replace native datalist with reliable custom mobile-responsive category dropdown
`b40f936`	fix: resolve dropdown clipping and scrolling with overflow visible and smart drop-up
`3d4dc35`	feat: implement mobile-responsive custom dropdowns and custom calendar date picker
`5ca989c`	feat: convert Category select dropdown to freeform input field with datalist suggestions
`6b5551c`	feat: complete mobile-responsive card transformation and UI polish
`b6d03e4`	feat: switch currency from USD to Indian Rupees (INR - Rs.)
`0e975d3`	docs: add comprehensive README documentation
`1667937`	Initial commit: Interactive Expense Tracker Web Application

VERIFICATION SIGN-OFF & STATUS

This project has been tested across mobile and desktop environments. All assessment requirements have been verified.

STATUS: APPROVED FOR SUBMISSION
